

Today, marco has a yearly turnover of approximately 15 million Euro and employs over 100 people.

Since 1982 our engineers, technicians, designers and programmers have been creating control systems and modular products for industrial applications. We have developed a series of reliable system components for many industrial sectors. Our high quality and extremely durable ceramic drives are produced in series. Integrating our components in a customer-specific application is an important part of the service we offer.

Some typical examples of products since 1982 are ultrasonic position-measuring systems in liquids, laser-optic measurement appliances, printers for industrial applications and customer-specific solutions for the control and operation of heavy machinery. **marco** controllers were used to set up almost all of the test-courses for leading German car manufacturers.

Investments

After German reunification, the design department of the Hermsdorf/Thüringen ceramics plant became part of **marco**. The Hermsdorf branch has remained autonomous. These additional 35 employees together with ceramic technology have widened the scope of our company - not only in technical and commercial areas. Intensive teamwork based on piezoceramic technology has given birth to the product ranges actuators, sensors and valves. These product lines are being continually improved and developed. As yet, they are mainly sold in Germany, however, interest on the European and international markets is growing.
